

Stage 2 Validation Architecture – Media Delivery Pipeline

Purpose: Validate artifact understanding, arrow-label support, handoff teaching, why-here teaching, and role inference without introducing enterprise multi-rail complexity.

Architecture Flow

Content Provider
↓ (MP2)
Ingest Service
↓ (MP2)
Transcoder
↓ (H.264)
Packager
↓ (MPD)
Origin
↓ (HTTPS)
Edge Cache
↓ (HTTPS)
Player

Numbered Steps

1. Content Provider uploads source media to Ingest Service.
2. Ingest Service forwards source media to Transcoder.
3. Transcoder converts source media into delivery-ready video renditions.
4. Packager generates MPD manifests for downstream delivery.
5. Origin stores packaged delivery artifacts.
6. Edge Cache retrieves delivery artifacts from Origin.
7. Player requests content through Edge Cache.

Glossary

MP2 = MPEG Transport Stream
MPD = DASH Manifest
Origin = Service responsible for serving packaged content
Edge Cache = Content delivery cache near viewers
Transcoder = Service that converts media formats
Packager = Service that prepares content for delivery

Operational Notes

Transcoder reduces playback compatibility issues.
Packager prepares delivery artifacts for downstream consumption.
Origin provides a centralized delivery source.
Edge Cache reduces latency and origin load.
